ABSTRACT

A method for low-pressure spray cleaning and residual contaminant analysis of components includes providing a receiver tank filled with flushing medium, pressurizing the receiver tank with compressed air on the inlet side, transmitting the pressurized flushing medium to a spray lance, spray cleaning a component by spraying the flushing medium from the spray lance, collecting the particle-containing flushing medium after the spray cleaning in a collection tank, providing an inline analysis filter positioned on an outflow side of the collection tank in such a way that particle-containing flushing medium flows through it, filtering the particles out of the flushing medium using the analysis filter, and finally analyzing the residual contamination filtered out by the analysis filter. A low-pressure spray module suitable for use with this method is also provided.
